

Clock Generation

Bus / CPU State Logic

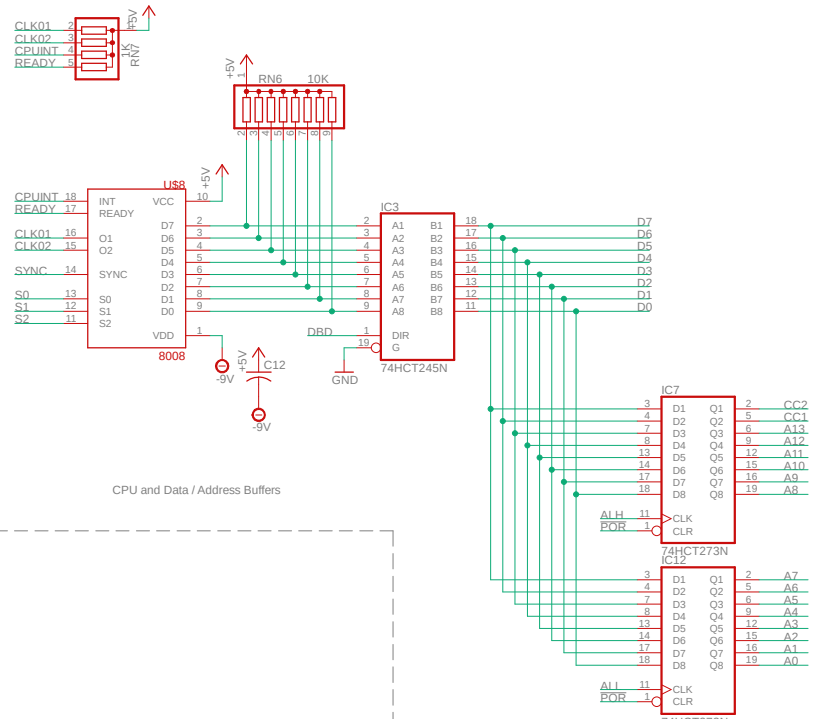

Reset Circuit

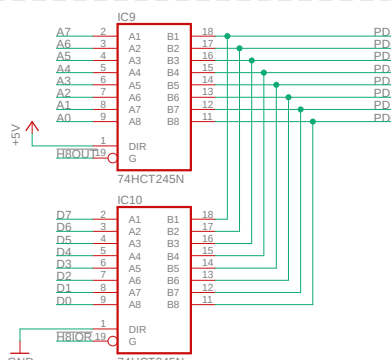

IO and RAM/ROM addressing

- rev 0.10
- Added 0.05 to each end
- rev 0.11
- Replace POR with READY
- Add resistors to ints
- Expose more interrupts on addr pins
- Add UART enable
- rev 0.12
- Update mmap consistent with latest h8-8008
- rev 0.13
- Schematic cleanup

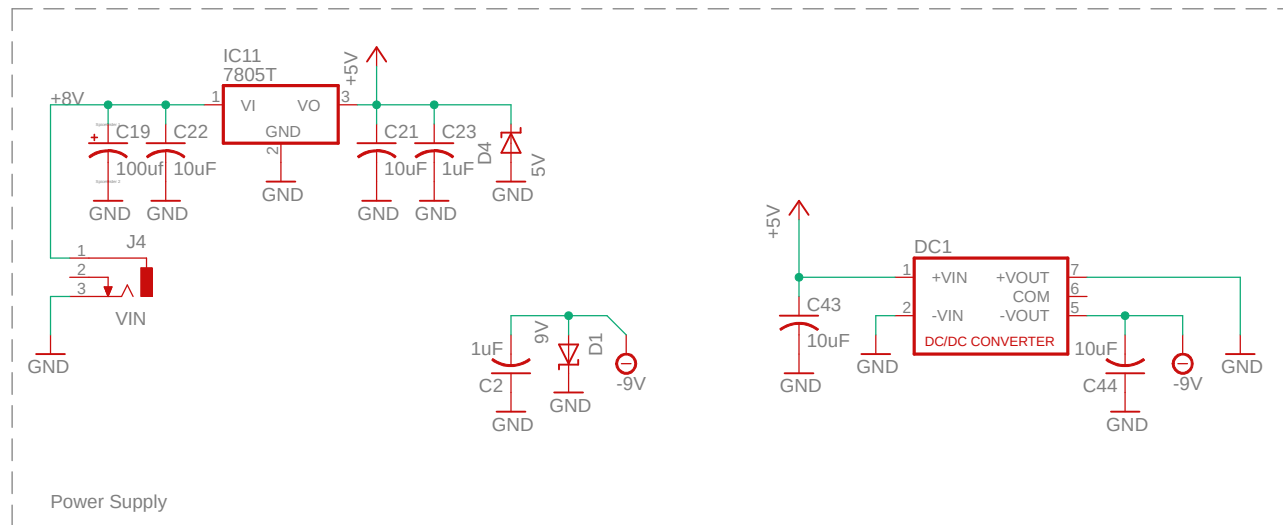

CPU and Data / Address Buffers

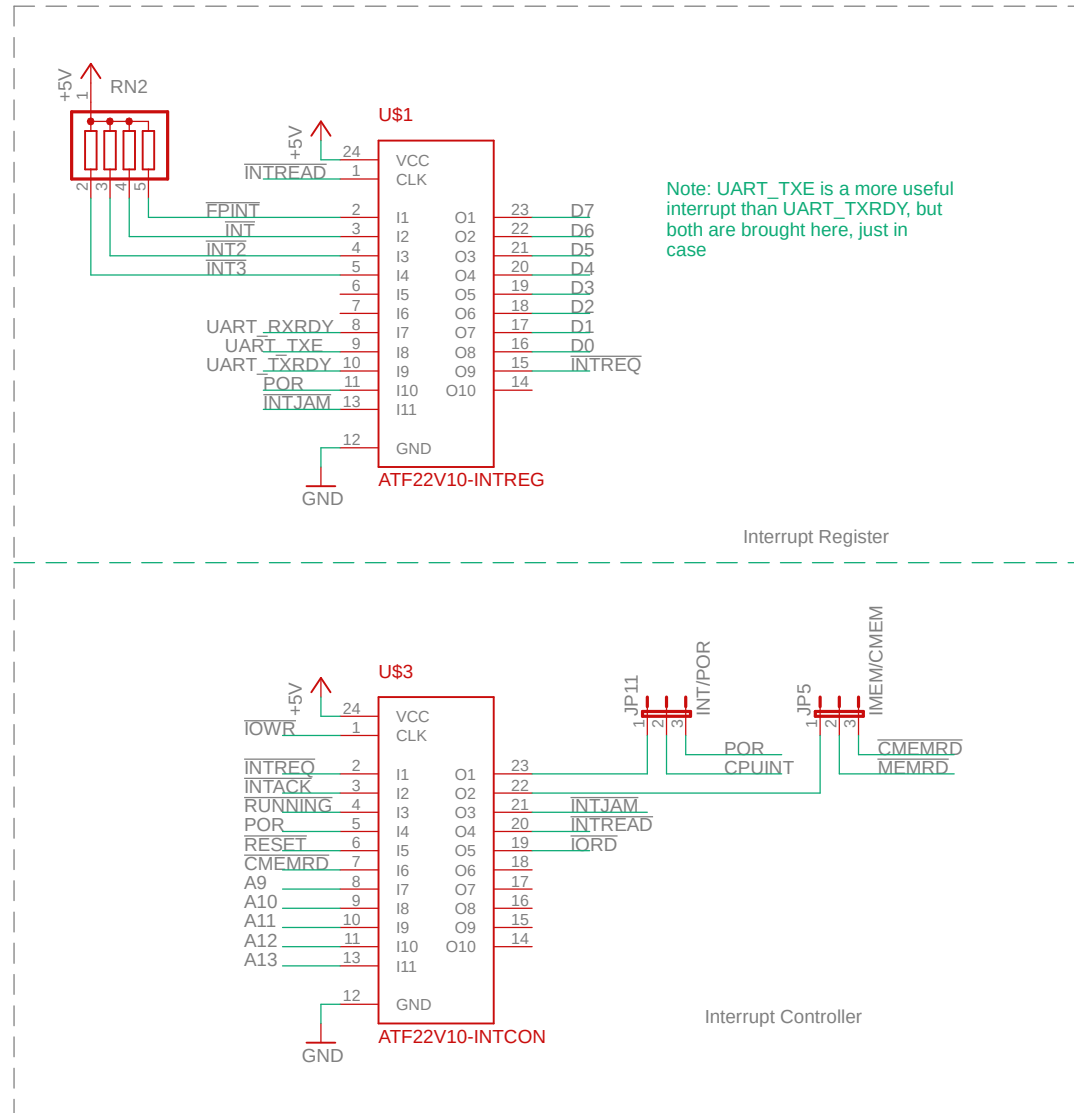

External Bus Buffers

Mini-08 8008 CPU Board
for Heathkit H8 Computer
<https://www.smbaker.com/>

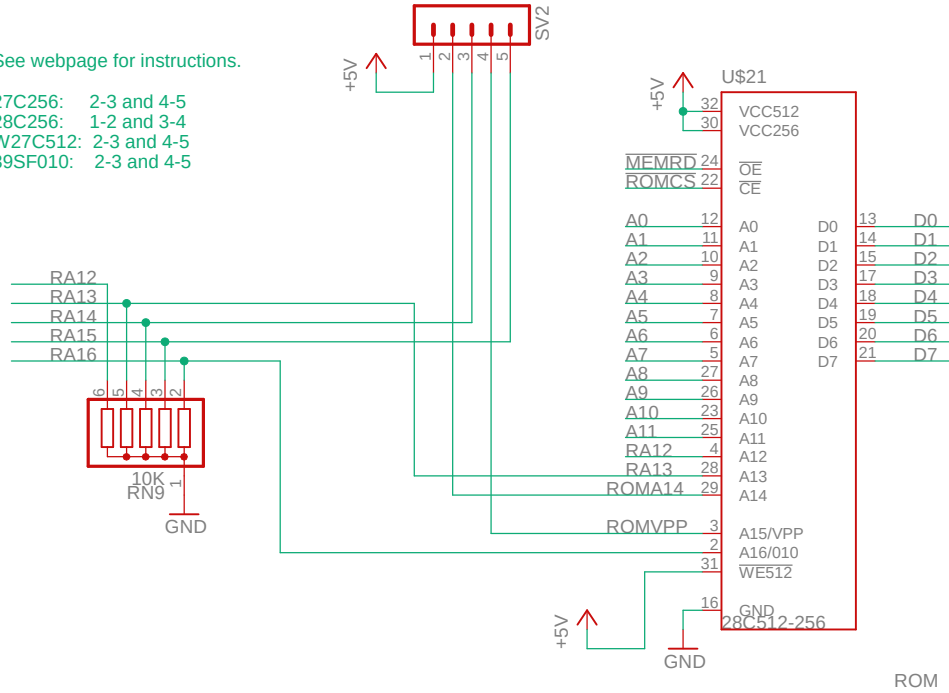

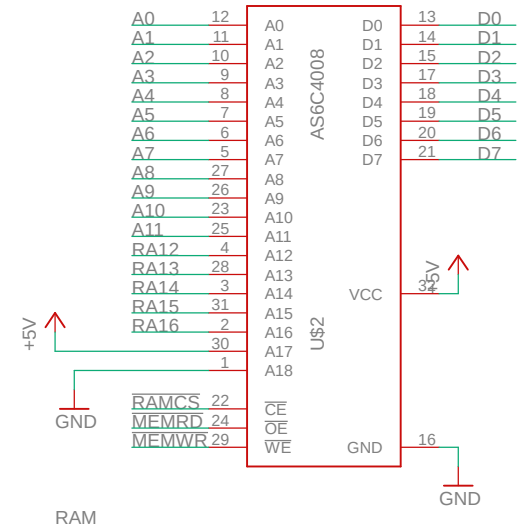

See webpage for instructions.

27C256: 2-3 and 4-5
 28C256: 1-2 and 3-4
 W27C512: 2-3 and 4-5
 39SF010: 2-3 and 4-5

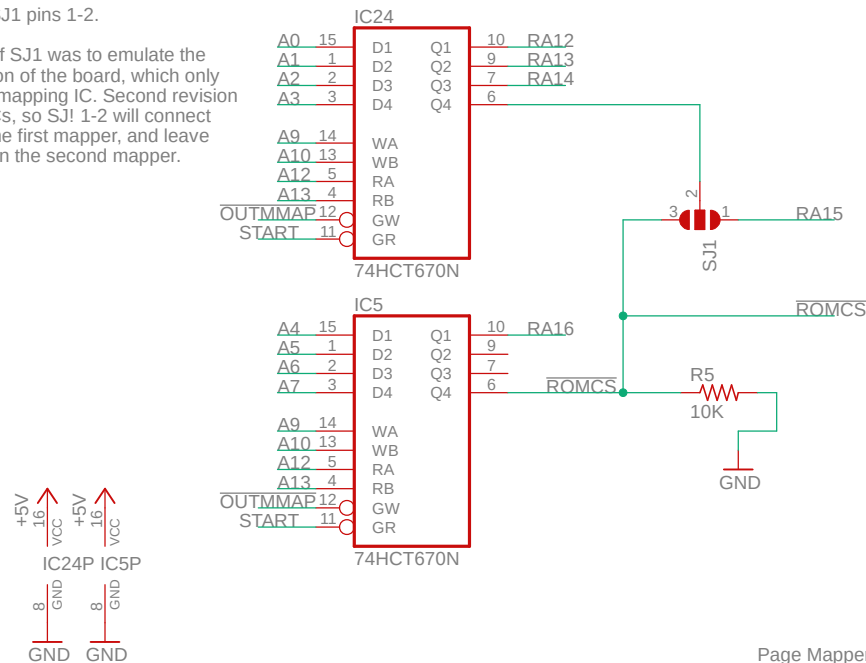

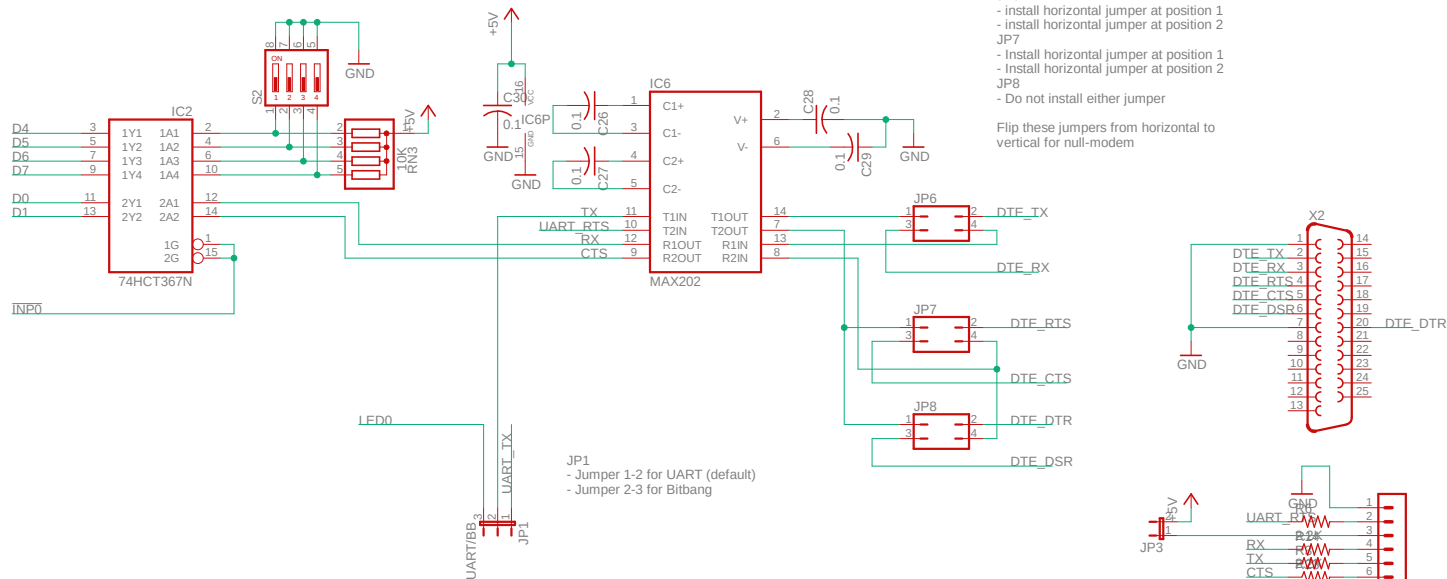

AS6C1008 should work in place of AS6C4008

Connect SJ1 pins 1-2.

Purpose of SJ1 was to emulate the first revision of the board, which only used one mapping IC. Second revision has two ICs, so SJ1 1-2 will connect RA15 to the first mapper, and leave ROMCS on the second mapper.

- JP6
- install horizontal jumper at position 1
- install horizontal jumper at position 2
- JP7
- install horizontal jumper at position 1
- install horizontal jumper at position 2
- JP8
- Do not install either jumper

Flip these jumpers from horizontal to vertical for null-modem

"The Real Deal" DB25 RS232 connector

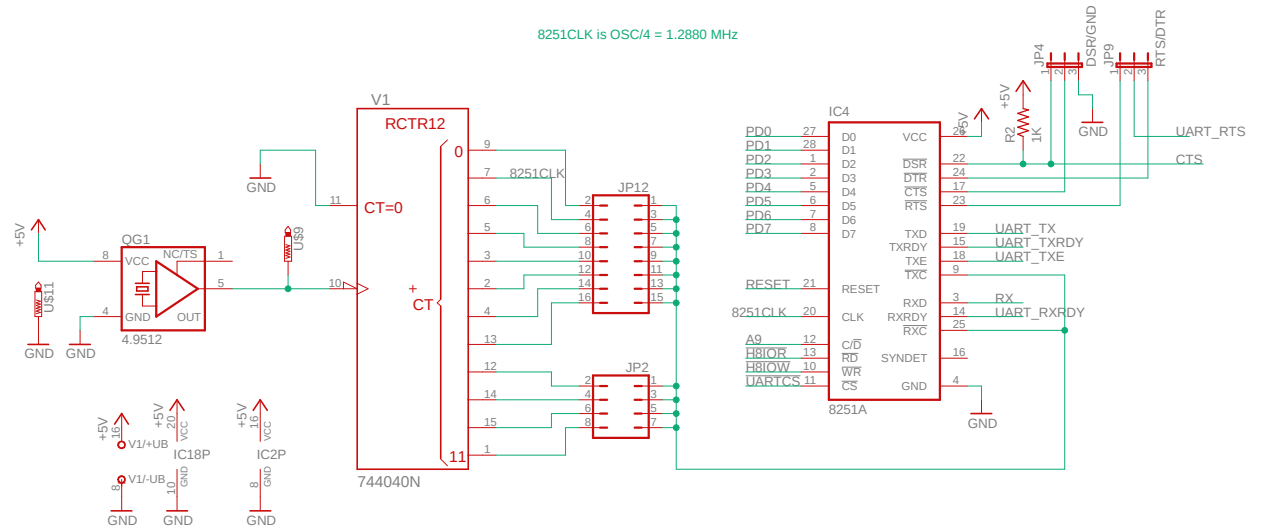

Optional 8-bit LED output port. Useful for debugging.
Also used for bitbang serial IO

JP12 / JP2 are the baud rate selectors
Populate only one jumper. I used two footprints as that's what eagle had at the time.

- JP12-1: 115200 Baud
JP12-2: 57600 Baud
JP12-3: 38400 Baud
JP12-4: 19200 Baud
JP12-5: 9600 Baud
JP12-6: 4800 Baud
JP12-7: 2400 Baud
JP12-8: 600 Baud
JP2-1: 300 Baud
JP2-2: 150 Baud
JP2-3: 75 Baud
JP2-4: 37.5 Baud (?)

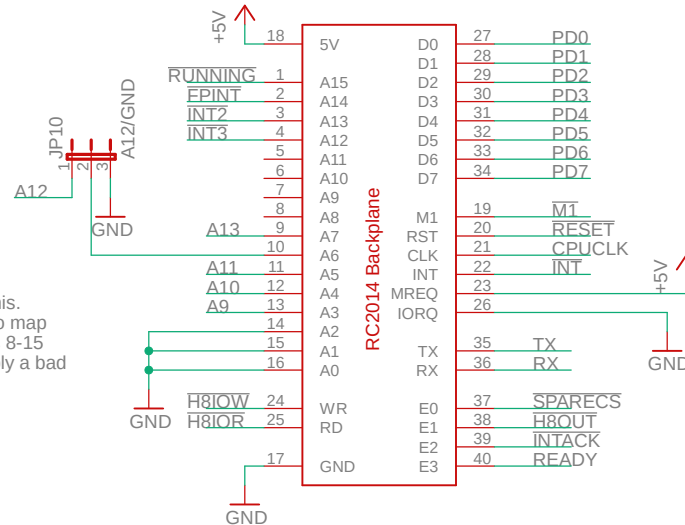

Baud rates > 19200 probably don't work.

- JP4:
1-2: CTS connected to DSR
2-3: CTS always on (default)
- JP9:
1-2: RTS is RTS (default)
2-3: RTS is DTR

8251CLK is OSC/4 = 1.2880 MHz

JP10:
 1-2: A6 is A12 (default)
 2-3: A6 is GND. I forget why I did this.
 Something to do with wanting to map
 input ports 0-8 and output ports 8-15
 to the same addresses. Probably a bad
 idea.

External Bus Connector
 Mostly RC2014 Compatible

The 8008 only has 5-bits of IO port address space, so they're mapped to the high address bits on the RC2014 bus (A3-A7). RC2014 address bits A0-A2 are always low.

MREQ is forced high. Memory never goes to this bus.

IOREQ is forced low. All Reads and Writers to this bus are IO (not memory).

Address bits A12-A15 are repurposed to hold some useful 8008 signals.
